

Blonde ray (*Raja brachyura*) in Division 7.e (western English Channel)

ICES advice on fishing opportunities

ICES advises that when the precautionary approach is applied, landings should be no more than 213 tonnes in each of the years 2023 and 2024. ICES cannot quantify the corresponding catches.

Management of the catches of skates and rays under a combined TAC prevents effective control of single-stock exploitation rates and could lead to overexploitation of some species.

Stock development over time

ICES cannot assess the stock and exploitation status relative to the maximum sustainable yield (MSY) and precautionary approach (PA) reference points because the reference points are undefined.

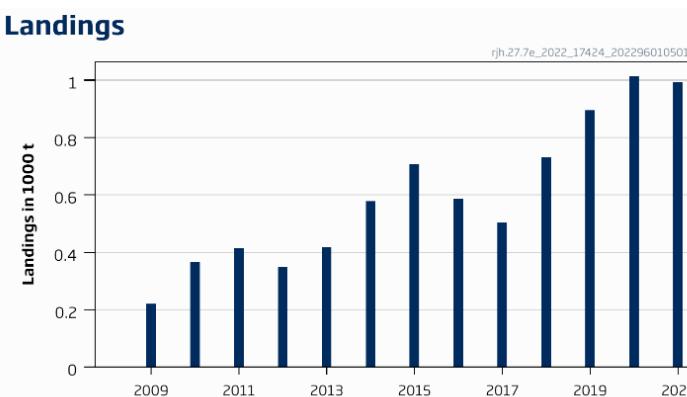

Figure 1 Blonde ray in Division 7.e. ICES estimated landings (in tonnes).

Catch scenarios

ICES framework for category 5 stocks was applied (ICES, 2012). For stocks without information on abundance or exploitation, ICES considers that a precautionary reduction of catches should be implemented where there is no ancillary information clearly indicating that the current level of exploitation is appropriated for the stock. The precautionary buffer was last applied in 2018 and has therefore been considered in 2022. The stock status relative to reference points is unknown; therefore, the precautionary buffer was applied in the advice.

Discarding is known to take place, but ICES cannot estimate the quantity or the corresponding dead catch.

Table 1 Blonde ray in Division 7.e. The basis for the catch scenarios.

Advised landings for 2021–2022 (issued in 2020)	266 tonnes
Discard rate	Unknown
Precautionary buffer	Applied
Landings advice*	0.8
% advice change**	213 tonnes
	-20 %

* Advised landings for 2023–2024.

** Advice value for 2023 and 2024 relative to the advice value for 2021 and 2022.

The advised landings for 2023 and 2024 are 20% lower than advised for 2021 and 2022 because the precautionary buffer has been applied.

Basis of the advice

Table 2 Blonde ray in Division 7.e. The basis of the advice.

Advice basis	Precautionary approach
Management plan	ICES is not aware of any agreed precautionary management plan for blonde ray in this area.

Quality of the assessment

Despite improvements in species-specific reporting in recent years, some misidentification at species level is still possible, especially between blonde ray and spotted ray. Stock-specific landings data are not available before 2009. The increase in landings from 2009 to 2015 might have been also influenced by the introduction and improvement in species-specific reporting of skate landings.

Issues relevant for the advice

Blonde ray is an important commercial species, accounting for about one-third of the skate landings in Division 7.e. It is a bycatch in demersal fisheries but may be targeted in areas of high local abundance due to its large size and high market value. Restrictions on fishing for undulate ray from 2009 onwards may have redirected fishing effort to this species.

The stock structure of blonde ray in the western English Channel is unknown. It is a coastal species that has a patchy distribution and is often found in greater abundance in sand bank habitats.

Catches of Skates and rays are managed under a common TAC. However, most landings are reported by species (ICES, 2022b). ICES considers that management of the catches of several stocks under a combined TAC prevents effective control of single-stock exploitation rates and could lead to overexploitation of some stocks.

Reference points

No reference points are defined for this stock.

Basis of the assessment

Table 3 Blonde ray in Division 7.e. The basis of the assessment.

ICES stock data category	5 (ICES, 2022a)
Assessment type	No assessment (ICES, 2022b)
Input data	Landings data 2009–2021
Discards and bycatch	Discarding is known to take place but has not been quantified
Indicators	None
Other information	None
Working group	Working Group on Elasmobranch Fishes (WGEF)

History of the advice, catch, and management

Table 4 Blonde ray in Division 7.e. History of ICES advice and ICES estimates of landings*. All weights are in tonnes.

Year	ICES advice	Landings corresp. to advice	ICES landings
2011	No specific advice		414
2012	No specific advice		349
2013	No TAC, species-specific measures needed, catch to decrease by at least 20%	-	419
2014	No new advice, same as 2013	-	579
2015	<i>Status quo</i> for skate TAC	310	708
2016	No new advice, same as 2015	310	587
2017	Precautionary approach	≤ 333	504
2018	Precautionary approach (same value as advised catches for 2017)	≤ 333	732
2019	Precautionary approach	≤ 266	896

Year	ICES advice	Landings corresp. to advice	ICES landings
2020	Precautionary approach	≤ 266	1014
2021	Precautionary approach	≤ 266	992
2022	Precautionary approach	≤ 266	
2023		≤ 213	
2024		≤ 213	

* There is no specific TAC for this stock. Fishing opportunities are managed through an overall TAC by management unit, which includes all species of skates and rays.

History of the catch and landings

The distribution of this stock does not extend into the NEAFC Regulatory Area.

Table 5 Blonde ray in Division 7.e. Catch distribution by fleet in 2021 as estimated by ICES.

Catch	Landings				Discards
	Beam trawl 18%	Bottom trawl 44%	Nets 35%	Other gears 3%	
Unknown	992 tonnes				Unquantified

Table 6 Blonde ray in Division 7.e. History of landings. ICES estimates of landings by country (in tonnes). Blank cell = no data reported; 0 = value less than 0.5.

Year	Belgium	France	UK	Ireland	Netherlands	Total
2009	6	56	159			221
2010	3	148	215			365
2011	5	205	204			414
2012	5	169	175	0	0	349
2013	6	191	222		0	419
2014	3	281	295			579
2015	6	304	396	2		708
2016	11	223	352			587
2017	9	242	251	2	0	504
2018	14	396	323		0	732
2019	10	450	435	0	0	896
2020	23	538	451	1	1	1014
2021	18	539	434		1	992

Summary of the assessment

There is no assessment for blonde ray in this area.
